

ABSTRACT OF THE DISCLOSURE

A method and apparatus for conducting a casino-type game of chance that includes placing at least three unexposed cards from a playing card deck on at least three designated areas of a playing surface with one card on each of the at least three designated areas. A player is 5 provided an opportunity to make at least one first wager in at least one of a first wager area and a second wager area. The first wager area identifies card content based on possible wagers for numerical value combinations corresponding to at least two cards to be revealed of the at least three unexposed cards. The second wager area identifies card content dependent upon at least one face card revealed in the at least two cards to be revealed. The at least two cards of the at 10 least three unexposed cards is then revealed and any winning wager of the at least one first wager made by the player is then paid according to the combination of the at least two cards exposed.
